

3. PROBLEM STATEMENT

A normal image classification model may learn colour-related information while learning the design of a saree.

For example, if most floral sarees in the training dataset are red, the model may incorrectly associate the red colour with the floral category.

Therefore, the problem addressed by this project is:

To develop a saree design recognition system that can recognize saree patterns while reducing the influence of saree colour.

4. OBJECTIVES

The main objectives are:

1. To develop a saree image classification system.
2. To recognize different saree designs.
3. To reduce the effect of colour during design recognition.
4. To use image augmentation during model training.
5. To use transfer learning for simple and efficient model development.
6. To create a simple web application for uploading saree images.
7. To display the predicted design and confidence score.
8. To test the model using sarees with different colours.
